Matrices

Michał Drab

1. Task Topic

Book Management (14)

2. Project analysis

I started working on the program from making a schedule of smaller tasks to perform.

Project's Schedule:

- ✓ Input data loading
- ✓ Operations on the matrices
- ✓ Recording data to the output file (additional function)

3. External specification & 4. Internal specification.

The manual for the further user of the program.

Contents:

- ➤ What does the program?
- ➤ How the program works?
- ➤ How to operate the program?
 - o How should the input file look like?

The program is made to calculate matrices. This is simple calculator. We can add and subtract matrices, multiply it, calculate determinant of the matrix and inverse it, we can check if the matrix is orthogonal and we can transposition matrices.

At first the program shows us the menu. We can choose which operation we want to do. We can:

```
Wybierz odpowiednią opcję:
1. Dodawanie macierzy.
2. Odejmowanie macierzy.
3. Mnożenie macierzy.
4. Obliczenie wyznacznika i odwracanie macierzy M1.
5. Ortogonalność macierzy M1.
6. Transponowanie macierzy M1.
0. Wyjście.
```

If we decided what we want to do, we have to enter the number (0-6). What should looks like input file?

It should have name 'dane.txt'.

File structure should looks like in the image.

In the first row we have size of the matrix (in this case it's 4x4) then we have matrix.

5. Testing

We can see input data on the picture above this text. Program read this and now we can choose option.

```

```

First I will add those matrices:

As we can see the result is correct. Now substract:

Now I will multiply these matrices:

Now I will choose option nr 4 – determinant and matrix inverse

As we can see it works.

Now I will choose option nr 5 (orthogonal matrix):

```
Logical Columnia Colu
```

Option nr 6 – transposition:

Now we can exit. I created additionally function to save data in output file.
